NO. 46

## A STUDY OF THE PELLAGRA-PREVENTIVE ACTION OF CANNED SALMON

By JOSEPH GOLDBERGER<sup>1</sup> and G. A. WHEELER, *Surgeons, United States Public Health Service*

In many of the smaller and more isolated industrial communities, as well as in much of the rural area of the South in which pellagra is endemic, the fresh-meat supply is often very restricted, especially in the spring and summer months. During this period fresh meat is, to a varying degree, replaced by preserved meats of some sort, often including fish. Among the preserved fish, canned salmon appears to be quite generally used. This observation led to a test (1) of its blacktongue-preventive action in the dog, resulting in full protection against this condition.

As the study in the dog showed clearly that canned salmon has a decided preventive value in blacktongue, and, in view of the abundant evidence (1) (2) (3) that canine blacktongue is the analogue of human pellagra, a comparable study of the value of canned salmon in pellagra was organized at the Georgia State Sanitarium, Milledgeville, Ga., in October, 1927, through the courtesy and sustained cooperation of the board of trustees, superintendent, officers, and staff. The results of this study are reported here.

As in the experimental work in the dog, canned Alaska chum salmon was used. The chum salmon is one of the cheaper grades, and for this reason was the one selected for study. The entire contents of the can (454 grams), including bone, skin, and liquid portion, were thoroughly mixed and incorporated in the cooked cereal-legume portion of the basic diet. Each patient was allowed six ounces of salmon per day, receiving approximately 1.7 ounces with the morning and evening meals and 2.6 ounces at midday. The composition of the salmon-supplemented diet is shown in the accompanying table.

<sup>1</sup> This study was organized prior to the death of Surgeon Goldberger and was, for the most part, conducted under his direction. The manuscript was prepared by the junior author.

TABLE 1.—*Approximate composition<sup>1</sup> of a salmon-supplemented diet offered daily to each of a group of white insane female pellagrins*

[Total calories 2,050]

Diet		Nutrients			
Articles of diet	Quantity	Protein	Fat	Carbohydrate	
Basic:	Grams	Grams	Grams	Grams	
Cornmeal <sup>1</sup> .....	256	21.5	12.0	159.4	
Cowpeas <sup>2</sup> .....	42	8.98	.6	25.5	
Wheat flour.....	21	2.4	.2	15.8	
Lard.....	49		49.0		
Tomato juice <sup>3</sup> .....	126				
Supplemental:					
Canned salmon <sup>4</sup> .....	168	55.1	12.4		
Cod-liver oil.....	14		14.0		
Calcium carbonate.....	3				
Sirup iodide of iron (U. S. P.) (2 drops).....					
Dilute hydrochloric acid (U. S. P.) (90 drops).....					
Total nutrients.....		68.98	88.2	230.7	

<sup>1</sup> Except for salmon, factors used for computing are from Atwater and Bryant, Office of Experiment Stations, U. S. Department of Agriculture Bulletin No. 28, 1906.

<sup>2</sup> Whole maize, sifted in kitchen and made into cornbread and "mush."

<sup>3</sup> The variety known as California black-eyed pea. Ground into a coarse meal and boiled.

<sup>4</sup> Expressed juice of canned tomatoes.

<sup>5</sup> Alaska chum salmon (canned). Analysis made in the division of chemistry, Hygienic Laboratory.

A total of 18 white female patients came under observation for pellagra-preventive treatment with this diet during the period of the test, all of whom remained under continuous observation for a period of not less than one year. None of these presented, at any time, symptoms suggestive of pellagra. In the light of repeated experience it seems safe to state that, without the salmon or some other equivalent preventive food in the diet, not less than 40 or 50 per cent of them would have suffered a recurrence within a period of from three to seven months. The fact that none of the group showed symptoms even suggestive of pellagra would seem to be convincing evidence of the pellagra-preventive action of the salmon and of the presence of the pellagra-preventive factor in canned Alaska chum salmon. The quantity of salmon allowed was fairly liberal. Whether a smaller allowance might have been equally effective can not be stated.

The demonstration that salmon contains the pellagra-preventive factor is of considerable interest. In the first place it is a readily available preserved food, comparatively cheap, and, if used in sufficient quantity, constitutes a dependable substitute for fresh meat, at least in so far as the pellagra-preventive factor is concerned. The results are also in harmony with certain previously recorded experiments showing that substances possessing blacktongue-preventive potency are also preventives of pellagra, and thus furnishes additional evidence that blacktongue in dogs is the analogue of pellagra in man.

## SUMMARY AND CONCLUSIONS

1. Canned salmon (Alaska chum) contains the pellagra-preventive factor.

2. By reason of its potency in the P-P factor, and its availability in the preserved state, salmon may be considered a fair substitute for meat in the areas of pellagra endemicity when meat is not readily available.

3. The demonstration of the pellagra-preventive value of canned salmon furnishes further evidence of the soundness of the working hypothesis that blacktongue of dogs is the analogue of pellagra in man.

## CITY HEALTH OFFICERS, 1929

## Directory of Those in Cities of 10,000 or More Population

Directories of the city health officers in the cities of the United States having a population of 10,000 or more have been published in the *Public Health Reports*<sup>1</sup> for each year from 1916 to 1928 for the information of health officers and others interested in public-health activities. These directories have been compiled from data furnished by the health officers. The cities included in this directory are those having 10,000 or more population.

The asterisk (\*) indicates that the officer so designated has been reported to be a "whole-time" health officer. For this purpose a "whole-time" officer is defined as "one who does not engage in the practice of medicine or in any other business but devotes all his time to official duties."

## STATE AND INSULAR HEALTH AUTHORITIES, 1929

## Directory, with Data as to Appropriations and Publications

Directories of the State and insular health authorities of the United States for each year from 1912 to 1928 have been published in the Public Health Reports<sup>1</sup> for the information of health officers and others interested in public-health activities. The present volume (1929), like those formerly issued, has been compiled from information furnished by the respective State and insular health officers, and includes data as to appropriations and publications.

Where an officer has been reported to be a "whole-time" health officer, that fact is indicated by an asterisk (\*). For this purpose a "whole-time" health officer is defined as "one who does not engage in the practice of medicine or in any other business, but devotes all his time to official duties."

## ALABAMA

Board of censors of the State medical association acting as a committee of public health:

Bibb Graves, governor, ex officio chairman, Montgomery.

Fred W. Wilkerson, M. D., Montgomery.

W. D. Partlow, M. D., Tuscaloosa.

**ADMISSIONS TO HOSPITALS FOR THE INSANE, MARCH, 1929**

Reports for the month of March, 1929, showing new admissions to hospitals for the care and treatment of the insane, have been received by the Public Health Service from 100 institutions located in 35 States, the District of Columbia, and the Territory of Hawaii. These hospitals reported a total of 151,301 patients (80,071 male and 71,230 female) on March 31, 1929, including those on parole.

The following table shows the number of new admissions for the month of March, 1929, by psychoses:

Psychoses	Number of first admissions		
	Male	Female	Total
1. Traumatic psychoses	12	6	18
2. Senile psychoses	153	98	251
3. Psychoses with cerebral arteriosclerosis	171	77	248
4. General paralysis	201	44	245
5. Psychoses with cerebral syphilis	24	18	42
6. Psychoses with Huntington's chorea	2	2	4
7. Psychoses with brain tumor	1	0	1
8. Psychoses with other brain or nervous disease	35	11	46
9. Alcoholic psychoses	89	14	103
10. Psychoses due to drugs and other exogenous toxins	24	6	30
11. Psychoses with pellagra	7	15	22
12. Psychoses with other somatic diseases	44	42	86
13. Manic-depressive psychoses	165	214	379
14. Involution melancholia	15	41	56
15. Dementia præcox (schizophrenia)	313	275	588
16. Paranoia and paranoid conditions	28	40	68
17. Epileptic psychoses	37	27	64
18. Psychoneuroses and neuroses	19	36	55
19. Psychopathic personality	23	6	29
20. Psychoses with mental deficiency	51	45	96
21. Undiagnosed psychoses	85	86	171
22. Without psychosis	146	47	193
Total	1,645	1,150	2,795

Fifty-eight and nine-tenths per cent of the new admissions were males and 41.1 per cent were females, giving a ratio of 143 males per 100 females.

At the end of the month 14,128 patients were on parole, 7,754 male and 6,374 female. The number on parole was 9.7 per cent of the male patients, 8.9 per cent of the female patients, and 9.3 per cent of the total.

Cases of dementia præcox constituted 21 per cent of the first admissions; manic-depressive psychoses, 13.6 per cent; senile psychoses, 9 per cent; psychoses with cerebral arteriosclerosis, 8.9 per cent; general paralysis, 8.8 per cent; without psychosis, 6.9 per cent; and undiagnosed psychoses, 6.1 per cent.

#### PATIENTS IN INSTITUTIONS FOR THE FEEBLE-MINDED, JANUARY TO MARCH, 1929

Reports for the first quarter of the year 1929 have been received by the Public Health Service from 27 institutions for the care of the feeble-minded located in 22 States, including one institution for females only with more than 1,200 patients. The total number of patients in these institutions on March 31, 1929, including those on temporary leave or otherwise absent but still on the books, was 33,857.

The first admissions were as follows:

	Male	Female	Total
January.....	159	131	290
February.....	176	130	306
March.....	207	161	368
Total.....	542	422	964

Of the first admissions during the three months, 56.2 per cent were males and 43.8 per cent were females, the ratio being 128 males per 100 females.

On March 31, 1929, there were 17,329 male patients and 16,528 female patients on the books. During the three months 258 patients were discharged—145 male patients and 113 female patients. One hundred and seventy male patients and 108 female patients died.

The annual death rates based on the estimated number of patients on the books of the institutions the middle of February were: Males, 40.2 per 1,000; females, 26.6 per 1,000; persons, 33.5 per 1,000.

The following table shows the numbers of patients in the institutions and on temporary leave on January 1, and at the end of each month

of the first quarter of 1929, and the percentage of the total patients who were on leave:

	Jan. 1, 1929	Jan. 31, 1929	Feb. 28, 1929	Mar. 31, 1929
<b>Patients in institutions:</b>				
Male.....	14,609	14,910	15,039	15,032
Female.....	14,453	14,656	14,812	14,774
Total.....	29,062	29,566	29,851	29,826
<b>Patients on temporary leave:</b>				
Male.....	2,471	2,202	2,183	2,277
Female.....	1,883	1,746	1,713	1,734
Total.....	4,354	3,948	3,896	4,031
<b>Total patients on books:</b>				
Male.....	17,080	17,112	17,222	17,329
Female.....	16,336	16,402	16,525	16,528
Total.....	33,416	33,514	33,747	33,857
<b>Per cent of total patients on temporary leave:</b>				
Male.....	14.5	12.9	12.7	13.1
Female.....	11.5	10.6	10.4	10.6
Total.....	13.0	11.8	11.5	11.9

#### GENERAL CURRENT SUMMARY AND WEEKLY REPORTS FROM CITIES

The 95 cities reporting cases used in the following table are situated in all parts of the country and have an estimated aggregate population of more than 31,395,000. The estimated population of the 88 cities reporting deaths is more than 29,820,000. The estimated expectancy is based on the experience of the last nine years, excluding epidemics.

## City reports for week ended October 26, 1929

The "estimated expectancy" given for diphtheria, poliomyelitis, scarlet fever, smallpox, and typhoid fever is the result of an attempt to ascertain from previous occurrence the number of cases of the disease under consideration that may be expected to occur during a certain week in the absence of epidemics. It is based on reports to the Public Health Service during the past nine years. It is in most instances the median number of cases reported in the corresponding weeks of the preceding years. When the reports include several epidemics, or when for other reasons the median is unsatisfactory, the epidemic periods are excluded and the estimated expectancy is the mean number of cases reported for the week during non-epidemic years.

If the reports have not been received for the full nine years, data are used for as many years as possible, but no year earlier than 1920 is included. In obtaining the estimated expectancy, the figures are smoothed when necessary to avoid abrupt deviation from the usual trend. For some of the diseases given in the table the available data were not sufficient to make it practicable to compute the estimated expectancy.

Division, State, and city	Population, July 1, 1928, estimated	Chicken pox, cases reported	Diphtheria		Influenza		Measles, cases reported	Mumps, cases reported	Pneumonia, deaths reported
			Cases, estimated expectancy	Cases reported	Cases reported	Deaths reported

<sup>1</sup> Rabies (in man), 1 case and 1 death at Detroit, Mich.

The following table gives the rates per 100,000 population for 98 cities for the 5-week period ended October 26, 1929, compared with those for a like period ended October 27, 1928. The population figures used in computing the rates are approximate estimates, authoritative figures for many of the cities not being available. The 98 cities reporting cases have an estimated aggregate population of more than 31,000,000. The 91 cities reporting deaths have nearly 30,000,000 estimated population. The number of cities included in each group and the estimated aggregate populations are shown in a separate table below.

*Summary of weekly reports from cities, September 22 to October 26, 1929—Annual rates per 100,000 population, compared with rates for the corresponding period of 1928<sup>1</sup>*

## DIPHTHERIA CASE RATES
